[ABSTRACT OF THE INVENTION]

A syringe guide for a syringe and ~~vile~~ vial is disclosed. The syringe guide serves as a guide for the needle to be inserted into the ~~vile~~ vial. The syringe guide can be made in different sizes, with different materials, and using different constructive ways. It consists of a pipe having a large diameter at one end and a small diameter at the opposite end. The ~~vile~~ vial and syringe are placed in the syringe guide according to their relative diameters. The diameter of the syringe guide can increase due to the slit running the entire length. A wall inside the syringe guide where the small and large diameters of the pipe meet supports the ~~vile~~ vial. When withdrawing medication while both the ~~vile~~ vial and syringe are in the guide, one does not have to hold the ~~vile~~ vial. The syringe guide makes working with a needle, cleaner, and easier.
